-!- FUNCTION: ACYL-PROTEIN SYNTHETAGE ACTIVATES TETRADECANOIC ACID.

IT IS A COMPONENT OF THE FATTY ACID REDUCTASE COMPLEX RESPONSIBLE FOR COMPURFING TETRADECANOIC ACID. TO THE ALDERVIDE WHICH SERVES AS SUBSTRATE IN THE LUCFERASE-CAMPLYZED REACTION.

-!- CATALYTIC ACTIVITY: ATP + an acid + protein = AMP + diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                              ;
                                                                                                                 antigen HA-1 R-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a new peptide (F1) constituting a T-cell epitope cheainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. Pi is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents part of the minor histocompatibility antigen HA-1 H-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the CDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe applacite anemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a new peptide (F1) constituting a T-cell epitode obtainable from the minor histocompatibility antigen HP-1. The peptide is immunogenic and can be used as part of a vaccine. Pi is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to read (auto) immune diseases. In particular it can be used with home marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                         Minor histocompatibility antigen, HA-1, T-cell epitope, immunological, graft versus host disease, bone marrow transplant, leukaemia, vaccine, diagnosis, aplastic anaemia, immune deficiency disease.

```
The present sequence represents an immunogenic peptide constituting a T-cell epitope, obtainable from the minor histocompatibility antigen HA-1. The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce telerance for transplants so as to prevent sejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases. Neoplastic haematopoietic cells presenting the peptides, in an HLA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, T-cell receptor, b- and T-cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Sequences AAUT1093-AAUT1796 represent the 1019728-related protein and peptide fragments of the protein. 103P328 exhibits tissue specific many cancers including timburs of the prostate, but it is also aberrantly expressed in many cancers including timburs of the prostate, bladder, kidrey, colon, lung, breast, rectum and stomach. The 103P3E8 polynucleotide, its related useful for diagnosing and stomach. The 103P3E8 polynucleotide, its related polynucleotide which encodes a single chain monoclonal antibody, that chaminospecifically binds to an 103P3E8 related protein, and a ribozyme capable of cleaving a polynucleotide having the 103P3E8 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P3E8. The sequences can be used in diagnostic methods to monitor the level of 103P3E8 gene products in serum, blood, urine and tissue and to thereby detect the presence of

                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                            ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                         The present sequence represents a new peptide (PI) constituting a T-ceil epitope obtainable from the minor histocomparibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. Pi is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence from preserved region VI of prenyl diphosphate synthetase (PDS), was used in the preparation of primers for the amplification of PDS DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Substances synthesised by PDS, i.e. polyprenyl diphosphates, are precursors of physiologically active substances, e.g. vitamin K and ubiquinones.
                                                                                A new minor histocomparibility antigen, HA-1 - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Prenyl diphosphate synthetase; polyprenyl diphosphate, vitamin K_{\rm r} ubiquinone; preserved region VI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA encoding prenyl diphosphate synthetase subunit(s) - new
Micrococcus prenyl diphosphate synthetase subunit polypeptide(s)
and methods for preparing enzymes from subunit(s)

The present sequence is a randomised DNA-binding domain on the alpha-helix of a zinc finger of the transcription factor zifz68. It was alpha-helix of a zinc finger of the transcription factor zifz68. It was concreted in an example to illustrate an invention relating to a library of DNA sequences; where N is at least 3. Each sequence has one of the 4N sequences, where N is at least 3. Each sequence has one of the 4N sequences of a DNA sequence of length N. The library is useful for designing a zinc finger polypeptide having specificity for a particular DNA sequence. Typically a zinc finger motif is designed, produced by recombinant or synthetic methods and ontacted with an immobilised DNA library. Briding is detected and the specificity and affinity of the zinc finger protein may be modified to increas in the specificity and affinity. The library is also useful for determining the preferred base recognition specificity of zinc finger proteins. The designed zinc finger proteins are useful for therapy, e.g. targeting mutations in targeting double stranded DNA, for diagnosis, e.g. detecting mutations in gene sequences, and for DNA purification.
                                                                                                                                                                               Human immunodeficiency virus type 1, HIV-1, zinc finger protein; 21f268;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AUV1093-AAUV1736 represent the 103P2E8-related protein and peptide fragments of the protein. 103P3E8 exhibits tissue specific many cancers including tumours of the prostate, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidhey, colon, lung, breast, rectum and stomach. The 103P3E8 polymolectide, its related protein and peptide fragments and specific PCR primers are therefore useful, for diagnosing and treating cancer. A vector comprising a memorspecifically binds to an 103P3E8 related protein, and a ribozyme capable of cleaving a polymolectide having the 103P3E8 coding sequence, are both useful in the preparation of a composition for treating a parient with a cancer that expresses 103P3E8. The sequences can be patient with a cancer that expresses 103P3E8. The sequences can in diagnostic methods to monitor the level of 103P3E8 gane products in serium, blood, urine and tissue and to thereby detect the presence of

The present invention relates to novel human cancer-related genes and proteins (AB27912C-AB279168 and ABR01789-ABR01661). The genes and proteins are useful for eliciting a humanal or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the adjagnosis and/or prognosis of cancer, as coding sequence capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                             New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response
             Human; cytostatic; vaccine; cancer; immune response; HLA; human leukocyte antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           54.8%; Score 23; DB 24; Length 9; 71.4%; Pred. The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABX01789-ABR01861). The genes and proteins are useful for alloiting a humoral or callular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, manAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic prognostic and diagnostic reagents for cancer. The present sequence is a numan leukocyte antigen (MLA) peptide, used in an example from the invention.
                                                                                                                                                                                   New composition comprising a substance that modulates the structure of
proteins and polynuclectides, useful for therapeutic, prognostic and
diagnostic reagents for eliciting cellular or humoral immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response

WPI; 2003-075555/07.

Claim 13; Page 313; 1021pp; English

cancer patients

```
The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78160 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or callular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proceins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present
The present invention relates to novel human cancer-related genes and proteins (ABZ70120-ABZ70168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humaner of cellular immune response. The genes are useful as probes and primers for the amplification and/or diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as the responsition and diagnostic reagents for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or hunoral immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ge W, Hubert RS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                    The present invention relates to novel human cancer-related genes and proteins (AB278120-AB278168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humonal or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the adjaponsis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic and diagnostic research for cancer. The prosest therapeutic and diagnostic research for cancer. The present sequence is a human leukocyte antigen (HLA) peptide, used in an example
                                                                      ţ
                                                                  New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20, Application US/09528706
Patent No. 6463985
GENERAL INFORMATION:
APPLICANT HUBBY
TITLE OF INVENTION: Retinoblastoma Protein - Interacting
TITLE OF INVENTION: Zinc Finger Proteins
NUMBER OF SEQUENCES: 106
CORRESPONDENCE ADDRESS:
ADDRESSEE: Campbell & Ficres LLP
STREET: 4370 La Jolla Village Drive, Suite 700
CITY: San Diego
STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                antigen HA-1 R-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as ablactection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents part of the minor histocompatibility antigen AA-1 H-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the CDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anamia, leukaemia and immune deficiency diseases, as well as

The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce tolerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases. Neoplastic haemacopoietic cells presenting the peptides, in an HLA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, T-cell receptor, B- and T-cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present sequence represents a new peptide (PI) constituting a T-cell peptiope obtainable from the minor histocompatibility antigen 49-1. The peptide is immunogenic and can be used as part of a vaccine. Pl is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the trearment of severe aplastic annexna, leukaemia, and immune deficiency
                  Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Minor histocompatibility antigen; FA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a new peptide (F1) constituting a T-cell septide obtainable from the minor histocompatibility antigen HN-1. The peptide is immunogenic and can be used as part of a vaccine. Pl is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                            Minor histocompatibility antigen; HA-1; T-cell epitope, immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.

Sequences AAU71093-AAU71796 represent the 103P3E8-related protein and peptide fragments of the protein. 103P3E8 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 103P3E8 polynuciectide, its related protein and peptide fragments and specific. PCR primers are therefore useful for diagnosing and treating cancer. A vector comprising a polynuciectide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P2E8-related protein, and a ribozyme capable of cleaving a polynuclectide having the 103P3E8 coding sequence, are both useful in the preparation of a composition for treating a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18389388; prostate; bladder; kidney; colon; lung; breast; rectum; stomach;
lung, breast, rectum and stomach. The 103P3E8 polytuoleotide, its relate protein and peptide fragments and specific PCR primers are therefore useful for diagnosing and treating cancer. A vector comprising a polymulospecifically binds to an 103P3E8 related protein, and a ribozyme apable of Cleanwing a longuable chain monoclonal antibody, that immunospecifically binds to an 103P3E8-related protein, and a ribozyme are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P3E8. The sequences can be used the diagnostic methods to monitor the level of 103P3E8 gene products in serum, blood, usine and tissue and to thereby detect the presence of cancerous cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tumcur, cancer, cytostatic, gene therapy, antibody therapy, ribozyme,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences AAU71093-AAU71796 represent the 103P186-related protein and peptide fragments of the protein, 103P328 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidney, colon,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            103P3EB; prostate; bladder; kidney; colon; lung; breast; rectum; stomach; tumour; cancer; cytostatic; gene therapy; antibody therapy; ribozyme; single chain monoclonal antibody; serum; blood; urine; tissue; human;
                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a new peptide (PI) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. PI is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monitoring 103P3E9 gene products in sample from patient (suspected of) having cancer, useful for diagnosing, managing or treating cancers, e.g. prostate cancer, comprises determining presence of aberrant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                       A new minor histocompatibility antigen, HA-1 - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation

0
patient with a cancer that expresses 103P3E8. The sequences can be used in diagnostic methods to monitor the level of 103P3E8 gene products in serum, blood, utine and tissue and to thereby detect the presence of cancerous cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HLA-A2 resistant tumor antigen peptides derived from SART-1, useful as preventives or diagnostics for tumors e.g. flat epithelloma like lung cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the isolation of Chlamydophila pheumoniae strain CML029 genes and their encoded proteins. The genes the invention encode an ATP binding cassette gene, a secretary locus open reading frame (ORF), an endopeptidase, a protease, a metalloprocease, CLP protease ATPase, a CLP protease subunit, a transglycolase/transpeptidase, a CLPC protease, or thioredoxin. The genes of the invention can be used in a vector as a vaccine for the prevention and treatment of Clamydia infections. AAU09440-AAU09473 represent B. or T-cell epitopes from the C. pneumoniae proteins (AAU09430-AAU09439) of the invention. These epitopes can be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vaccine useful for immunising mammals against chlamydia infections, comprises vectors having sequences of ATP binding cassette gene, secretary locus open reading frame gene of chlamydia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

The present invention describes a method (M1) for the isolation of a subset of peptides from a protein peptide mixture (P1). M1 involves:

(a) separating the protein peptide mixture [P1). M1 involves:

(c) chromatography: (b) chemically, or enzymatically, or chemically and chromatography; (c) chemically, altering at least one amino acid of at least one of the peptides; and (c) isolating the altered generating a subset of altered control of the peptides; and (c) isolating the altered (flagged) peptides out of each fraction via chromatography, where the chromatography of steps (a) and (c) isolating the altered (flagged) peptides out of each fraction via chromatography, where the chromatography of steps (a) and (c) isolation and determination of peptides from protein peptide of the isolation and determination of peptides from protein peptide (c) is performed with the same type of chromatography, M1 can be used for the isolation and determination of proteins indicative of a disease of protein marker or a specific set of proteins indicative of a disease state. M1 can be used for identifying target proteins present in the cannot marker or a specific set of proteins indicative of proteins of proteins of intracellular changes in cells with physiciogical changes such as metabolic shift, in the identification of bromaters in cannoers and in the identification of congest on the need for multidimensional chromatography and without the use of affinity tags. Assemblification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Proteome analysis, isolation, determination, diagnostic assay, detection, protein marker, identification, metastatic, invasive cancer, differential expression, signalling pathway, chromatography.
                                                                                                                                                                                                                                                             Method for isolation of peptides from complex mixture of peptides involves specific chemical and/or enzymatic alteration of at least

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method (MI) for identifying secreted intracellular bacterial proteins (BP). MI comprises: (a) selectively visualising BP by pulse labelling in the presence of an inhibitor of eukaryotic protein synthesis followed by 2D electrophoresis and autoradiography; (b) comparing protein profiles (PF) of purified bacteria to PF of total lysate (TL) of infected cells; and (c) identifying protein spots aresent in differential images from gels loaded with TL. The present sequence is one such bacterial peptide epitope which was identified by the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Proteome analysis; isolation; determination; diagnostic assay; detection; protein marker; identification; metastatic; invasive cancer; differential expression; signalling pathway; chromatography.

The present invention describes a method (M1) for the isolation of a subset of peptides from a protein peptide mixture (P1). X1 involves:

(a) separating the protein peptide mixture into fractions of peptides used chromatography; (b) chemically, or enzymatically, or chemically and enzymatically, or chemically and enzymatically, or chemically and enzymatically, or chemically and chromatography; (b) chemically, thereby generating a subset of altered peptides in each fraction, thereby generating a subset of altered peptides and chromatography, where the chromatography of steps (a) and fraction via chromatography, where the chromatography of steps (a) and (c) is performed with the same type of chromatography of steps (a) and c) is performed with the same type of chromatography. MI can be used for the absence or a variation in expression level of at least one protein marker or a specific set of proteins indicative of a disease state. MI can be used for identifying target proteins present in metastatic and invasive cancers, in differential expression of proteins in transgenic mice, identification of proteins that are upregallated or changes in cells with physiciogical changes such as metabolic shift, in the identification of biomarkers in cancers and in the identification of biomarkers in cancers and in the identification of containing pathways. The method is gel-free methodology for qualitative and quantitative proteome analysis without the need for multiply mand without the use of affiliative and proteins proteins and proteins and the proteins and proteins and the proteins and the proteins and 
                                                                                                                                                                                                                                                                                                                                                                                    Method for isolation of peptides from complex mixture of peptides involves specific chemical and/or enzymatic alteration of at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABP74714 to ABP75190 represent peptide sequences used in the exemplification of the present invention.

```
phosphostoma (Rb)-interacting zinc finger (RIZ) protein is a nuclear phosphoprotein that acts as a cell differentiation factor. RIZ can modulate cell growth by binding to Rb protein, which is involved in regulating cell proliferation. In addition, RIZ can act to regulate transcription. RIZ functions to maintain cells in the Gl phase of the transcription. RIZ functions to maintain cells in the Gl phase of the cell cycle, by interacting with Rb through the cr2 domain of RIZ. RIZ protein is a PR domain protein and is present primarily in the cell nucleus. RIZ gene mutations may be implicated in various cancers such as melanoma, neuroblastoma, leukaemia and breast cancer, and so the RIZ gene may use through for these disorders. Since RIZ protein is implicated in cell cycle arrest, inhibition of RIZ activity may be useful in meurodegenerative disorder therapy e.g. for Parkinson's, Huntingdon's or Alabeimer's disease, paralysis or motor neurone disorders, or cardiac disorders e.g. heart disease, where the ability to induce neural/ cardiac used in the analysis of PR domain peptides of the present invention.
                                                                                                                                                                                                                                                                                                   for
                                                                                                                                                                                                                                                                                New PR domain peptides comprising amino acid sequences from, for example retinoblastoma-interacting zinc finger, or egi-43 proteins, fregulating gene transcription and controlling cell proliferation and

The invention relates to a nucleic acid molecule encoding a FR domain peptide present in human and rat retinoblastoma protein-interacting zinc finger protein (RIZ), PRDI-BFI (human postive regulatory domain. I-binding factor I), 2V.-1 (human enciroptive in regulatory domain. myeloid transforming gene product) or Caenorhabditis elegans egl-43 gene product. The DNA of the invention is involved in regulating transcription of a target gene. RIZ acts as a cell-differentiation factor and modulates a function of a cell by binding to retinoblastoma (Rb) protein, which is involved in regulating call proliferation in various human diseases or conditions, e.g. cancer. RIZ regulates the growth of normal addit cardiac muscle cell death. RIZ les expressed in neural call dowing useful for healing after highry of neural tissue and for treating neurodegenerative diseases such as Parkinson's, Huntington's or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Alzheimer's disease and paralysis, or motor neuron disorders through induced or decreased proliferation of neural celis. The PR domain or RIZ active fragment containing a PR domain is useful as a probe to identify transcription factors or oncogenic proteins in a cell that bind the PR domain. Sequences AAU80803-AAU80854 represent protein and peptide
                                                                                                                                                                                                                                                                                                           Novel nucleic acid molecule comprises the code for a conserved domain of retinoblastoma protein-interacting zinc finger protein, positive regulatory domain I-binding factor involved in regulating gene
                                                                                                                                                                                                                                                                                                                                                                                                                      Example 3, Column 35, 93pp, English

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
